AUTHOR: Zhilin, Yu. L. (Moscow)

TITLE: Basic Relations on a Strong Stationary Shock Wave Which Causes a Jump of the Conductivity

PERIODICAL: Prikladnaya matematika i mekhanika, 1960, Vol. 24, No. 3, pp. 543-546

TEXT: The author considers the motion of a strong stationary shock wave in a non-viscous and non-heatconducting gas under a given electromagnetic field in front of the wave, if the following conditions are satisfied

1.) The magnetic Reynold numbers before and behind the shock wave satisfy the relations:

$$R_{m1} = \frac{4 \pi \tilde{\sigma}_1 U_1 L_1}{c_0^2} \ll 1 ; R_{m2} = \frac{4 \pi \tilde{\sigma}_2 U_2 L_2}{c_0^2} \gg 1,$$

where U_1 and U_2 , L_1 and L_2 , $\tilde{\sigma}_1$ and $\tilde{\sigma}_2$ are the characteristic velocities, linear measurements and conductivities before and behind the wave 2.) the ponderomotorical forces before the shock wave are small, i. e.

Basic Relations on a Strong Stationary Shock Wave Which Causes a
Jump of the Conductivity

$$\frac{H_1^2}{4\pi S_1 v_1^2} R_{m_1} \ll 1.$$

Under these assumptions the author sets up a closed system of equations for determining the gas and field parameters behind the wave, where he assumes in opposition to (Ref. 1,2) that the electric field before the wave does not depend on the magnetic field. Several simpler special cases are investigated. Finally the author shows that for an arbitrary electromagnetic field the considered stationary wave is not always realizable. In order that the interaction of a strong shock wave in the gas with an electromagnetic field can be reduced to a stationary wave, the field before the wave must satisfy certain conditions (which are not given).

There are 3 Soviet references.

Zhilin, Yu.L. (Moscow)

A special case of the interaction of a strong stationary shock wave in a gas with an electromagnetic field

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeloniye tekhnicheskikh nauk. Mekhanika i mashinostroyeniye, no.2, 1962, 129-130

TEXT:

This paper is concerned with the case where the strong shock waves affect the medium parameters in such a way that the conductivity of the gas increases from zero to a certain value and then vanishes again. Thus, outside the wave the conductivity of the gas is zero, while within the wave it has a finite value giving rise to the appearance of electric currents and a resulting interaction between the ionized gas and the electromagnetic field. The analysis is confined to the special case where the velocity is perpendicular, and the electric and magnetic fields tangential, to the shock wave. The equations describing the stationary motion of a conducting gas and the Maxwell electromagnetic field equations

Card 1/2

A special case of the interaction ... S/179/62/000/002/010/012
E032/E514

are used in conjunction with a mathematical model of the shock wave to obtain a quantitative description of the phenomena. Electrical conductivity is assumed to be a function of pressure and enthalpy only and thermal conductivity is neglected. In general, the motion of the gas behind a shock wave turns out to occur at subsonic velocities. There is 1 figure.

AUTHOR: Zhilin, Yu.L. (Moscow)

TITLE: Similitude parameters at high hypersonic velocities

PERIODICAL: Prikladnaya matematika i mekhanika, v. 26, no. 2,
1962, 387 - 388

TEXT: It is shown that the ordinary similitude law for moderate Mach numbers, which requires coincidence of 2 similitude parameters, can be replaced, at high hypersonic velocities, by the requirement of coincidence of a single parameter - the effective Reynolds number R_0 . The analysis is based on dimensional theory and on the principle of hypersonic stabilization. The parameter R_0 is expressed by

$$R_0 = \frac{\rho_\infty U_\infty l}{\mu_0} \quad (\mu_0 = c T_0^n),$$

where l is the characteristic length of the body. Thus, the effective Reynolds number depends only on the density and velocity of

Card 1/3

Similitude parameters at high ...

S/040/62/026/002/024/025
D299/D301

the unperturbed flow, unlike the ordinary Reynolds number R_∞ , which depends also on the static temperature. At high hypersonic velocities, the ratio

$$\frac{R_0}{R_\infty} = \left[\frac{2}{(\gamma - 1)M_\infty^2} \right]^2, \quad R_\infty = \frac{\rho_\infty U_\infty l}{c T_\infty^n}$$

holds; hence an increasing Mach number at $R_\infty = \text{const}$, leads to a decrease in R_0 , i.e. to an increase in the effect of viscosity. As the parameter R_0 was introduced under the most general assumptions it characterizes a wide variety of effects which take place at high hypersonic velocities; transition effects, interactions, etc. In particular, Tsien's parameter $M_\infty / \sqrt{R_\infty}$, describing the effect of rarefaction, passes into the parameter $R_0^{-1/2}$, for $M_\infty \rightarrow \infty$. Under the same assumptions, the interaction is considered between the boundary layer and inviscid flow. Thereby it is shown that the dimensionless parameters

Card 2/3

Similitude parameters at high ...

S/040/62/026/002/024/025
D299/D301

$$\kappa, \sigma, n, T_w/T_0, M_\infty \tau, \tau^2 \sqrt{R_0} \quad (1)$$

are similitude parameters for the flow past affine-similar bodies (τ is the relative thickness of the body). The parameter $\tau^2 \sqrt{R_0}$ is more convenient than the parameter $\tau \sqrt{R_0}$ (used in the references), for $M_\infty \rightarrow \infty$, as it is directly determined from the parameters of the unperturbed flow. Formulas are given for the coefficients C_p , C_t and C_q , for the case of flow past slender affine-similar bodies.

With hypersonic stabilization, the parameters related to the Mach number of the unperturbed flow, are dropped from these formulas. There are 3 references: 1 Soviet-bloc and 2 non-Soviet-bloc. TITLE: Theory of entropy layers

SOURCE: Zhurnal priklad. mekhan. i tekhn. fiz., no. 1, 1964, 118-120

TOPIC TAGS: shock wave, entropy layer, law of flat section

ABSTRACT: The hypersonic flow of an ideal gas around thin bodies of various shapes is considered. The entropy layer is defined to be the portion of the stream near the body in which the accuracy of the law of flat sections is lower than γ^e where γ is the local slope of the wave jump, $2-2\chi < \gamma < 2$, and χ is the ratio of specific heats of the gas. It is shown that at sufficiently large distances (x) from the nose of the body the thickness of the entropy layer does not depend directly on the shape of the nose. For thin bodies of the form $r \sim x^n$ the thickness is given by

$$\delta \sim x^m, \quad m = 2 - s + n [n(1 + \nu) (\frac{1}{2}s - 1) + s - 1],$$

where

$$\frac{2}{3 + \nu} < n < 1$$

and ν is 0 for plane, or 1 for axial. symmetry. Flow is also considered around a

Card 1/2

ACCESSION NR: APL022660

sheet (or cylinder) of transverse dimension d with a wedge-shaped (or cone-shaped) nose. In the region of the stream bounded by streamlines intersecting the shock wave near the nose, it is found that the entropy layer is formed at a distance from the nose greater than x_{\max} given by

$$\left(\frac{x_{\max}}{d}\right)^{\frac{1+\gamma}{2+\gamma}} = 2^{\frac{1+\gamma}{2+\gamma}} \frac{\gamma}{3+\gamma} \left(\frac{1}{\gamma_0}\right)^{\frac{1}{2+\gamma} - \frac{1}{2+\gamma(1-\gamma)}}$$

where γ_0 is measured at the nose. Orig. art. has: 19 equations and 3 diagrams.

TITLE: A wing with minimum inductive drag close to the surface of the earth

SOURCE: AN SSSR. Izv. Otd. tekhn. nauk. Mekhanika i mashinostroyeniye, no. 1, 1964, 148-160

TOPIC TAGS: aerodynamics, fluid dynamics, fluid mechanics, drag, wing, lift, wing design

ABSTRACT: Consideration is given to the problem of a wing of finite span having a minimum drag at a given lift in a stream of uncompressible fluid close to the surface of the earth. A swirling sheet runs back from the trailing edge. The distance of this sheet from the surface of the earth is taken to be invariable. At a rather large distance downstream from the wing, the velocity induced by vortices may be disregarded and the flow may be considered two dimensional with considerable accuracy. Therefore as is usual in solving variation problems in an uncompressible fluid stream, a plane is introduced infinitely removed downstream from the wing (Trefftz plane). The expressions are given for the relationship between the lift of the wing and the drag. Zhurkovskiy's theorem and a hypothesis of plane sections is

PERIODICAL: Zhurnal Obshchey Khimii, 1957, Vol. 27, No. 1, pp. 215-227 (U.S.S.R.)

ABSTRACT: The properties of compounds (quaternary salts of dimethinemerocyanines) with polar substitutes - nitro- or diethylamino groups - in position 6 of the benzthiazole radical were investigated. The reaction of dimethyl sulfate with 3-ethyl-5-(3'-ethyl-6'-diethylaminobenzthiazolinilidene-2'-ethylidene)-thiazolidinthion-(2)-one-(4) is followed by methylation of the thion sulfur and formation of a cation center on the nitrogen ring atom of the rhodanine

Card 1/3

481

About Merocyanine Dyes Derivatives of Rhodanine

radical as well as the addition of the dimethyl sulfate to the diethylamino group. This results in the formation of a quaternary and double quaternary salt mixture with a prevalence of one of the two depending of course upon the reaction conditions. A study of the optical properties of the synthesized dyes showed that the entry of the methyldiethylammonium group into position 6 of thiadimethinecyanines, derivatives of 3-ethylrhodanine and 3-ethylthiazolidinedion-(2,4) causes considerable displacement of the absorption maximum toward the short wave zone as compared with the nonsubstituted dyes. It was noticed during the hydrolysis of quaternary salts that the reaction occurs at various rates depending upon the nature of the heterocyclic radicals and these dyes and the concentration of the solutions. Bathochromic displacement of the absorption maximum, the magnitude of which decreases with the increase in basicity of the heterocyclic radicals, was observed during the change over from merocyanine derivatives of 3-ethylrhodanine to quaternary salts. Quaternary salts with heterocyclic radicals, the basicity of which is reduced by the introduction of electronegative substitutes, have the highest hydrolysis rate.

TITLE: Merocyanine Dyes With Electron-Releasing Substituents in the Polymethine Chain (O merotsianinovykh krasitelyakh s' elektrodonornymi zamestitelyami v polimetinovoy tsepi)

PERIODICAL: Doklady Akademii Nauk SSSR, 1957, Vol. 114, Nr 2, pp.343-346 (USSR)

ABSTRACT: Among the merocyanine dyes substituted in the chain only dimethynmerocyanines have been investigated in sufficient detail, i.e. rhodanine derivatives with an alkyl or phenyl group in the polymethynchromophor. Therefore it was of interest to investigate the methods of synthesis and the properties of the di² and tetramethynmerocyanines which contain in an α -position an electropositive substituent, e. g. an alkoxyl, amino, or a substituted amino group. By the interaction of 3-ethyl-5-(α -ethoxyethyliden)-rhodanine ($R=C_2H_5$) with ethyl-p-toluenesulphonate of 2-ethylmercaptobenzthiazol in the alcohol medium and in presence of triethylamine at normal temperature, α -ethoxydimethynmerocyanine was obtained. In

Card 1/5

20-2-30/60

Merocyanine Dyes With Electron-Releasing Substituents in the Polymethine Chain

analogy hereto, α -ethoxysubstituted dimethynmerocyanines with rests of 6,7-tetramethylbenzthiazol, benzselenazol, chinoline benzoxazol and thiazolin were synthesized. The authors of the present paper furthermore succeeded in obtaining, by condensation of the 3-ethyl-5-(α -ethoxyliden)-rhodanine ($R=C_2H_5$) with quarternary salts of the vinyl derivatives of heterocyclic bases in an ethanol solution or in acetic anhydride in presence of triethylamylin, α -ethoxytetramethynmerocyanines with rests of benzthiazol, as well as of benzselenazol and 3,3-dimethylindolenin. It could be expected that the alkoxy group would have considerable mobility, and in particular a capacity of exchange with respect to the amino rest, which would make it possible for the authors to proceed to the α -aminosubstituted merocyanines which have not been described so far. This was actually the case, and after α -ethoxy- or α -methoxydimethynmerocyanine was heated, through one hour, with abundance of methylamine in alcohol solution, two dyes were insulated that are identical from the point of view of their properties. Their elementary composition shows that they are merocyanines with an ethylamino group in the α -position. The reactions with methyl-

Card 2/5

20-2-30/60

Merocyanine Dyes With Electron-Releasing Substituents in the Polymethine Chain

butyl-, nonyl-, dodecyl- and benzylamines took exactly the same course. In complete analogy hereto, the authors of the paper under review obtained, by action of ethylamine on appropriate α -ethoxymerocyanines, α -ethylaminosubstituted dimethynmerocyanines with rests of 6.7-tetramethylenebenz-thiazol, benzselenazol, chinoline, thiazoline, and tetramethynmerocyanine. The exchange of the ethoxy- or methoxy-groups in merocyanines of the I-structure (Figure in the paper under review) takes place at normal temperature, but is slower. The process of heating leads to a number of additional subsidiary processes. A totally different course is taken by the reaction of α -ethoxydimethynmerocyanine with aniline and secondary amines. A yellow substance is produced. So far it has not been possible to substitute both the ethoxy- and also the methylmercapto-group by aniline and diethylamine. It has been demonstrated that 3-ethyl-5-(α -ethoxyliden)-rhodanine reacts with aniline and piperidine exactly as easily as with ammonia and the primary aliphatic amines (e.g. methyl- and etheramine), with aminosubstituted ethyliden-rhodanides

Card 3/5

20-2-30/60

Merocyanine Dyes With Electron-Releasing Substituents in the Polymethyn Chain

being formed in this context. Here again substitution of the ethoxy group as compared to the rest of an aliphatic amine leads to a sharp decrease in the reactive capacity of the methyl group. As expected, the acetylation of the amino group in the compound denoted with IV leads to a noticeable increase of the mobility of the hydrogen atoms of the methyl group. Analogous syntheses were carried out, starting from the appropriate ethylidenrhodanines, of the α -phenylacetamino- and α -phenylacetaminomerocyanines. These can also be obtained by acetylation of appropriate α -amino-, α -ethylamino-, and α -phenylaminomerocyanines. There takes place in merocyanines, which contain rests of 6,7-tetramethylenbenzthiazol, benzselenazol, chinoline, and thiazoline, a shift of the maximum of absorption into the long-wave sphere, if an alkoxy- and ethylamine-group is introduced. Acetylation of the amino group results in a sharp bathochromic shift of the maximum of absorption of the dyes. There are 1 table, and 11 references, 5 of which are Soviet.

On the Electrochemical Behavior of Titanium ✓

S/080/60/033/011/004/014
A003/A001

PERIODICAL:

Zhurnal prikladnoy khimii, 1960, Vol. 33, No. 11, pp. 2526-2531

TEXT:

The electrochemical behavior of Ti is important for determining its corrosion resistance. Several phenomena observed during anode oxidation of titanium were investigated here. The stationary potential of titanium in a sulfuric acid solution of potassium sulfate containing 0.005-0.15 n hydrofluoric acid was 0.59 ± -0.66 v depending on the concentration of the hydrofluoric acid. The anode polarization curves are shown in Figures 2 and 3. It is evident that the anode process of titanium dissolution is accelerated, after passing a maximum it is slowed down and reaches a minimum at potentials of -0.2 ± 0.0 v. At higher potentials again a rise is observed corresponding to the separation of oxygen. It was shown that the stationary potential of titanium in a sulfuric acid solution of potassium sulfate has the same value as in hydrofluoric acid alone. It is assumed that the process of titanium dissolution takes place in the following way:

Card 1/2

On the Electrochemical Behavior of Titanium

S/080/60/033/011/004/014
A003/A001

The real polarization curves at negative potentials can be obtained as a result of the combination of two processes: 1) the anode oxidation of titanium, and 2) the reduction of hydrogen. The directly proportional dependence of the dissolution rate of passive titanium on the concentration of the hydrofluoric acid points to the diffusion character of the limitation of this dissolution process. The results obtained show that the fluorine ion is a strong activator of titanium. There are 7 figures, and 6 references: 2 Soviet, 3 English, 1 German. X

TITLE: Use of alkylarylphosphates for plasticizing polyvinylchloride 15

SOURCE: Plasticheskiye massy*, no. 5, 1963, 7-10

TOPIC TAGS: alkylarylphosphates, polyvinylchloride, plasticizers, esters, calendar method, sodium salts

ABSTRACT: The plasticizing qualities of DAFF (mixed ester of phenylphosphoric acid and 2-ethylexyl alcohol), prepared by a technique developed at NII PM from phenol, phosphoryl chloride, and 2-ethylhexyl alcohol, are compared to those of several other esters of phosphoric acid obtained in normal C sub 7 - C sub 9 alcohols and C sub 6 - C sub 8 isocanols and with the widely used plasticizers tricresylphosphate (TCP) and dibutylphthalate (DBP). The dialkylphenylphosphates are recommended as substitutes for the two latter plasticizers for obtaining soft fire- and frost-resistant polyvinylchloride plastics suitable for fabric base preparation by the calendar method. DAFF and the dialkylphosphates were superior in frost-resistance to DBP and TCP; they were more fire-resistant than DBP, but less so than TCP. The physico-mechanical properties of the individual dialkylphenylphosphates were

Card 1/2

L 12965-63

ACCESSION NR: AP3000394

not markedly different, though plasticizers containing a larger number of aryl groups yielded plastics which were less flammable but which had poorer frost-resistance. Increasing the amount of plasticizer used reduced the toughness of the resultant plastic by about 50%, but increased its frost-resistance. Lowering treatment temperature from 140 to 120C also decreased toughness. The presence of up to 50% sodium salts in DAFF had little effect on plasticizing conditions; larger amounts reduced plasticizer-polyvinyl-chloride compatibility and reduced the toughness and frost-resistance of the resultant plastic. Orig. art. has: 4 figures, 5 formulas, 2 tables. ²

Alcoholysis of Some Di- $\beta\beta'$ -Cyanethyl Esters, and
Investigation of Products Obtained

PERIODICAL:

Plasticheskiye massy, 1960, No. 10, pp. 60-61

TEXT: Proceeding from acrylonitrile the authors synthesized the following compounds: di-($\beta\beta'$ -cyanethyl)-sulfide; di- $\beta\beta'$ -cyanethyl ether; furthermore, $\beta\beta'$ -cyanethyl ethers of ethylene-, diethylene- and triethylene glycols and butanediols. By alcoholysis by means of 2-ethyl hexanediol one obtains the 2-ethyl hexyl esters of oxadipropionic acid, 2,4-dioxahexane dicarboxylic acid-1,6, 2,6-dioxaoctane dicarboxylic acid-1,8, 2,4,6-trioxaoctane dicarboxylic acid-1,8, 2,4,6,8-tetraoxadecane dicarboxylic acid-1,10, and thiodipropionic acid, [Abstracter's Note: the conditions under which the alcoholysis was performed are not indicated]. These esters were found to be resistant to frost down to -45 - -58°C (determination by L. I. Burinova), and yielded, when mixed

TITLE: Synthesis of hydroperoxides and the study of their initiating properties in
 the process of emulsion polymerization of mixtures of butadiene and styrene

SOURCE: Voronezh. Universitet. Laboratoriya khimii vysokomolekulyarnykh soyedineniy.
 Trudy, no. 2, 1963. Monomers, khimiya i tekhnologiya SK (Monomers, chemistry, and
 technology of synthetic rubber), 50-60

TOPIC TAGS: butadiene, styrene, copolymerization, organic oxide, emulsion
 polymerization, hydrocarbon, hydroperoxide

ABSTRACT: It was the object of this investigation to synthesize a number of halogen-
 containing organic hydroperoxides and the hydroperoxides of cymene, methane, 1,1-
 diphenyl-ethane and its derivatives, and to study the initiating properties of the
 synthesized compounds on the copolymerization reaction of butadiene and styrene. The
 various hydroperoxides were obtained by first synthesizing the corresponding hydro-
 carbons and then by subjecting the hydrocarbons to autooxidation. The following

Card 1/2

L 22028-66

ACC NR: AT6005938

hydrocarbons and halohydrocarbons were synthesized: oymene, p-methane, 1,1-diphenylthane, 1-phenyl-1-ethylphenylethane, 1-phenyl-1-cumene-ethane, chlorocumene, isopropylchlorocumene, bromocumene, isopropylbromocumene, and fluorocumene. The reaction yields and the characteristic physical constants for the synthesized compounds are tabulated. The initiating properties of the hydroperoxides in the copolymerization reaction of butadiene and styrene were studied in the presence of two redox systems: a) trilon B-rongalite-ferrous sulfate-hydroperoxide, and b) hydroquinone-sodium sulfite-ammonia-hydroperoxide. A 78% solution of Nekal and potassium soap of synthetic fatty acids or a mixture of potassium and sodium soaps of hydrated rosin and synthetic fatty acids ($C_{10} - C_{16}$) served as emulsifier. The experimental results are tabulated. It is concluded that the more active hydroperoxides produce the hardest rubbers which, when vulcanized, yield vulcanizates of high strength. 15

TITLE: Synthesis and autooxidation of isopropylcyclohexyl-
benzene

PERIODICAL: Zhurnal obshchey khimii, v. 32, no. 9, 1962, 2954-2957

TEXT: Experiments on the cycloalkylation of isopropylbenzene by cyclohexanol in the presence of sulfuric acid and the oxidation of the product thereof are described. The relative amounts of reagents taken for the alkylation varied from an isopropylbenzene/sulfuric acid molar ratio of 2:3 to 3:1.5 with 1 mole of cyclohexanol. The isopropylbenzene and sulfuric acid were mixed first, the cyclohexanol was added slowly (during 2.5-3 hrs) and the reaction was continued with stirring for another 4-5 hrs. The end of the reaction was indicated by a constant value of the refraction index of the organic phase. The main reaction product was isopropylcyclohexylbenzene; its yield was highest (81.2%) when the reagents were taken

Card 1/3

S/079/62/032/009/007/011
I048/I242

Synthesis and autooxidation...

in the ratio isopropylbenzene/sulfuric acid/cyclohexanol = 3/3/1, and lowest (48.4%) when this ratio was 3:1.5:1. Variations in the temperature, within the range 10-40°C, had no significant effect on yield. The yield of by-products (isopropylidicyclohexylbenzenes, cyclohexene polymers) varied between 10.2 and 23.5%. A chromatographic analysis showed that the isopropylcyclohexylbenzene is a 16:21:63 mixture of the O-, m-, and p-isomers. The isopropylcyclohexylbenzene was oxidized in air, at 110°C, in the presence of a small amount of an initiator (e.g., 1 wt % isopropylbenzene hydroperoxide) and a small amount of alkali (e.g., 0.1 wt % NaOH); the total yield of hydroperoxides varied between 67.0 and 71.5%, after a reaction time of 28-49 hrs. Among the hydroperoxides separated from the reaction product by extraction with NaOH were: n-isopropylcyclohexylbenzene dihydroperoxide (m.p. 105-106°C) and n-isopropylcyclohexylbenzene monohydroperoxide (m.p. 56-57°C). There are 2 figures and 2 tables.

AUTHORS: Zhilina, Ye. M. and Dombrovskaya, N. S.
TITLE: Electrolytic separation and chemical analysis of
 β -titanium from the alloy VTZ-1
PERIODICAL: Zhurnal prikladnoy khimii, v. 34, no. 10, 1961, 2345-2347

TEXT: The authors isolated one phase-- β -titanium, a high temperature modification with a space-centered cubic lattice--of the alloy VTZ-1 and determined its chemical composition. VTZ-1 is a titanium alloy composed of the solid solutions of α - (a low temperature form with a hexagonal lattice) and β -titanium; it contains 8.38% of Al, Cr, Mo, Si, Fe and C. The electrolytic method of phase separation was used since the alloy is completely dissolved by dilute acids. The initial procedure consisted of two stages: electrolysis of alloy samples inserted in glass cylinders, wrapped in tracing paper and placed in a solution of dil. HCl and methyl alcohol for 60 min. at a current density of 0.07 A/cm^2 with a cathode of two platinum discs, with subsequent roentgenometric and electronographic

analysis of the electrolytic residues after their filtration, washing and drying. According to the results, the residue is a pure phase of β -titanium stabilized by Cr and Mo. On analyzing both the residue and electrolyte by colorimetric techniques, the authors ascertained the composition of the β -titanium phase, i.e. 13% Cr, 7.0% Mo and 87% Ti. Thus, the residue is enriched by Cr and Mo in comparison with the alloy itself; Al, however, only occurs in the electrolyte along with part of the Mo and Cr. On the basis of previous work by I. Khansen (Ref. 4: *Struktura dvoynkh splavov* (Structure of Binary Alloys), Moscow, 1941), it is suggested that Cr is present in α -titanium together with all the Al, that some of the β -titanium was dissolved, and that the solubility of Mo is lower than is the case in the binary alloy Ti - Mo. There are 1 figure, 2 tables and 5 Soviet-bloc references.

Borisoglebov, A. M. Goncharov, Ya. G. Popodopulo, I. M. Yuritskiy, Candidate of Technical Sciences, and G. M. Iusova, Candidate of Technical Sciences; Ed.: V. I. Glukhov; Tech. Ed.: Y. A. Vashitsov.

PURPOSE: This collection of articles is intended for technical personnel in chemical machine building and other branches of the machine and instrument industry.

CONTENT: The collection deals with the results of investigations on the mechanical, corrosive, and engineering qualities of certain alloys. Also discussed are heat-treatment regimes, the phase composition of stainless steels, methods of checking products, and new designs of apparatus used in checking. References accompany each article.
